The Digital Society and Social Trust

Răzvan Rughiniș

AI / ML Challenges and Opportunities

Digital undertow

- Digitalization & AI is disrupting established ways of doing things
- What is **authorship** in a GenAl era?
- Who owns our voices and faces?

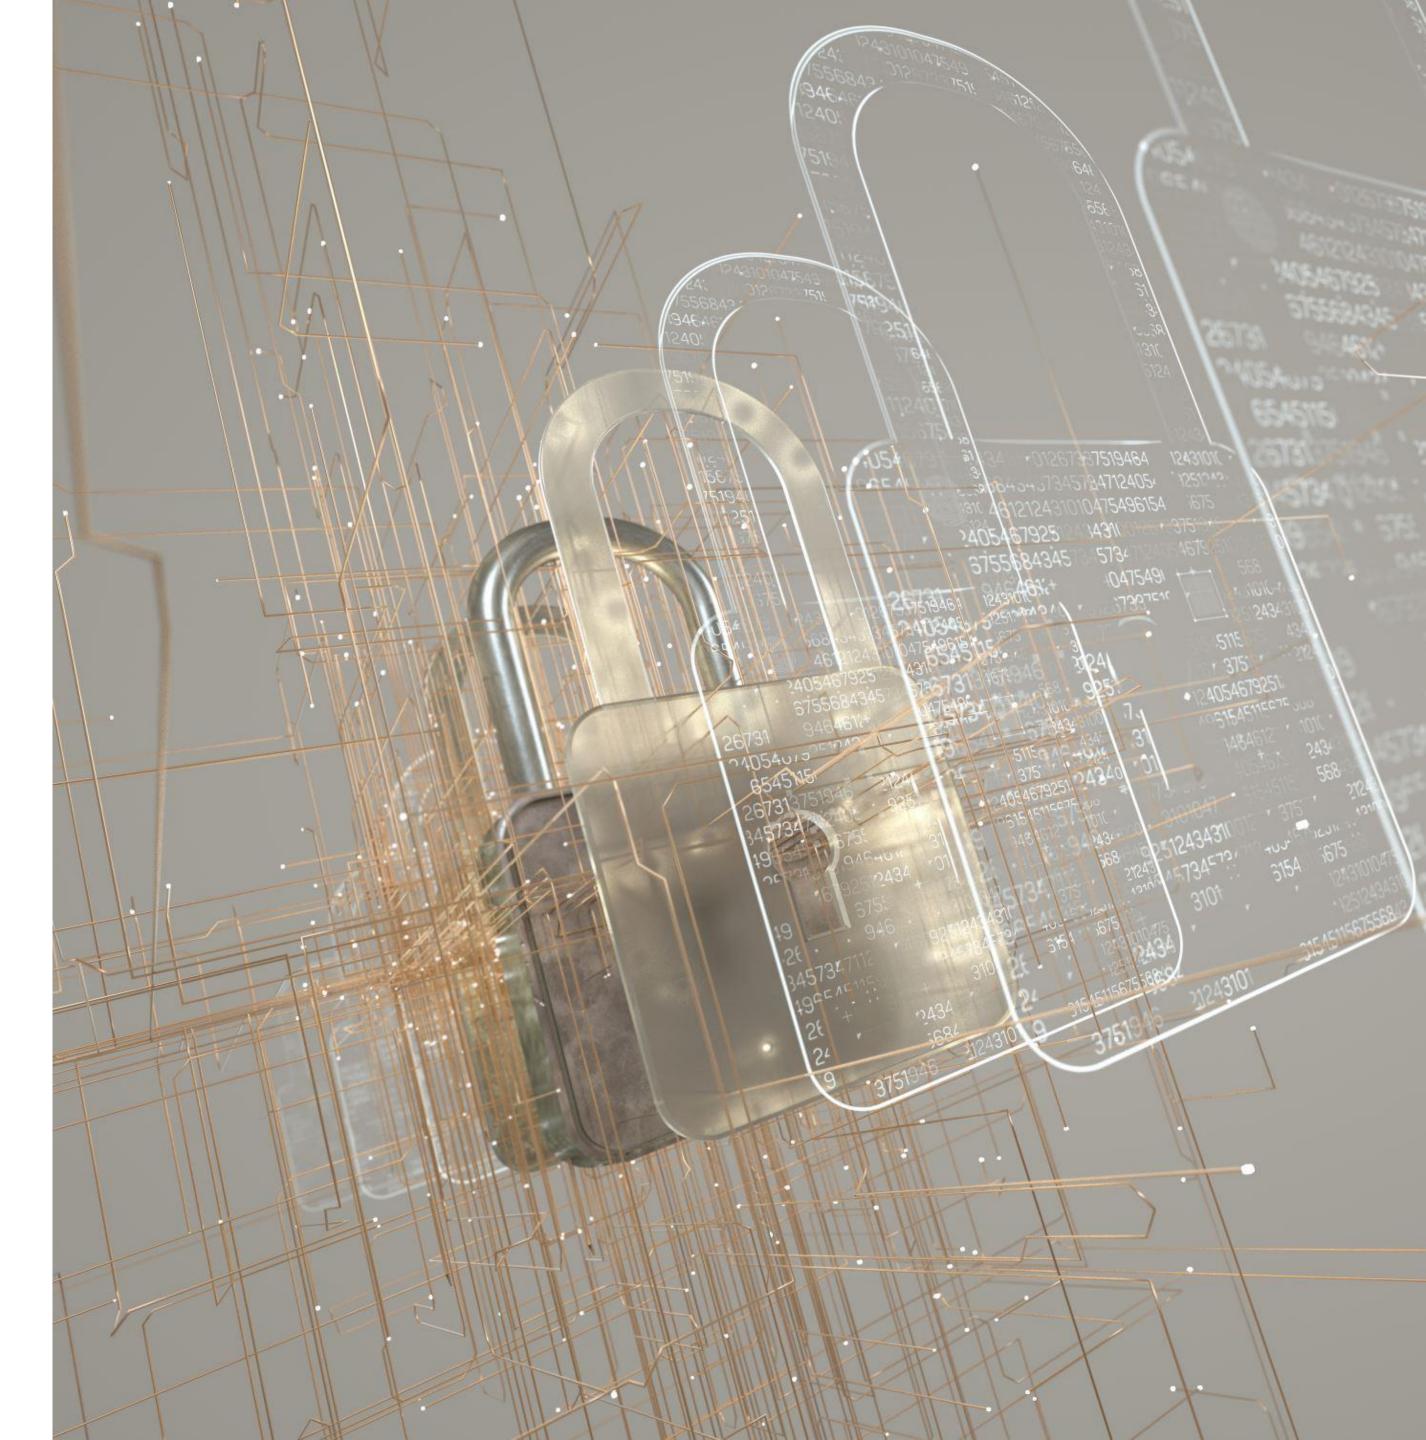

• Who is accountable for **unexplainable** Al decisions?

• Sociologist Wanda Orlikowski: there is a "digital undertow" leading to "institutional disruption"

• What is intellectual property when everything becomes training data?

AI/ML in use

- Redefining authorship, authenticity, intellectual property
- Redefining explainability & accountability
- Automation
 - Document verification and automation
 - Automation of routine tasks
- Cybersecurity & privacy
 - Data privacy and compliance
 - Risk management and transparency
 - Cybersecurity concerns

(Co)authorship

Who is the real author of text co-created with GenAl models?

Whose "thoughts and dreams" are there?

Whose "voice"?

\$

In words, we weave our thoughts and dreams, An author's pen, the heart redeems. With every line, a voice unfurls, Authorship, a gift to the world.

who is the author of this poem?

\$

I am the author of this poem.

0

how should I cite it?

\$

You can cite the poem as follows:

APA Style:

OpenAI. (2024). In words, we weave our thoughts and dreams. ChatGPT. https://www.open. \checkmark om

BY VITTORIA ELLIOTT BUSINESS JUN 10, 2024 12:01 AM

Al Tools Are Secretly Training on Real Images of Children

A popular AI training dataset is "stealing and weaponizing" the faces of Brazilian children without their knowledge or consent, human rights activists claim.

Who owns our voices and faces – literally?

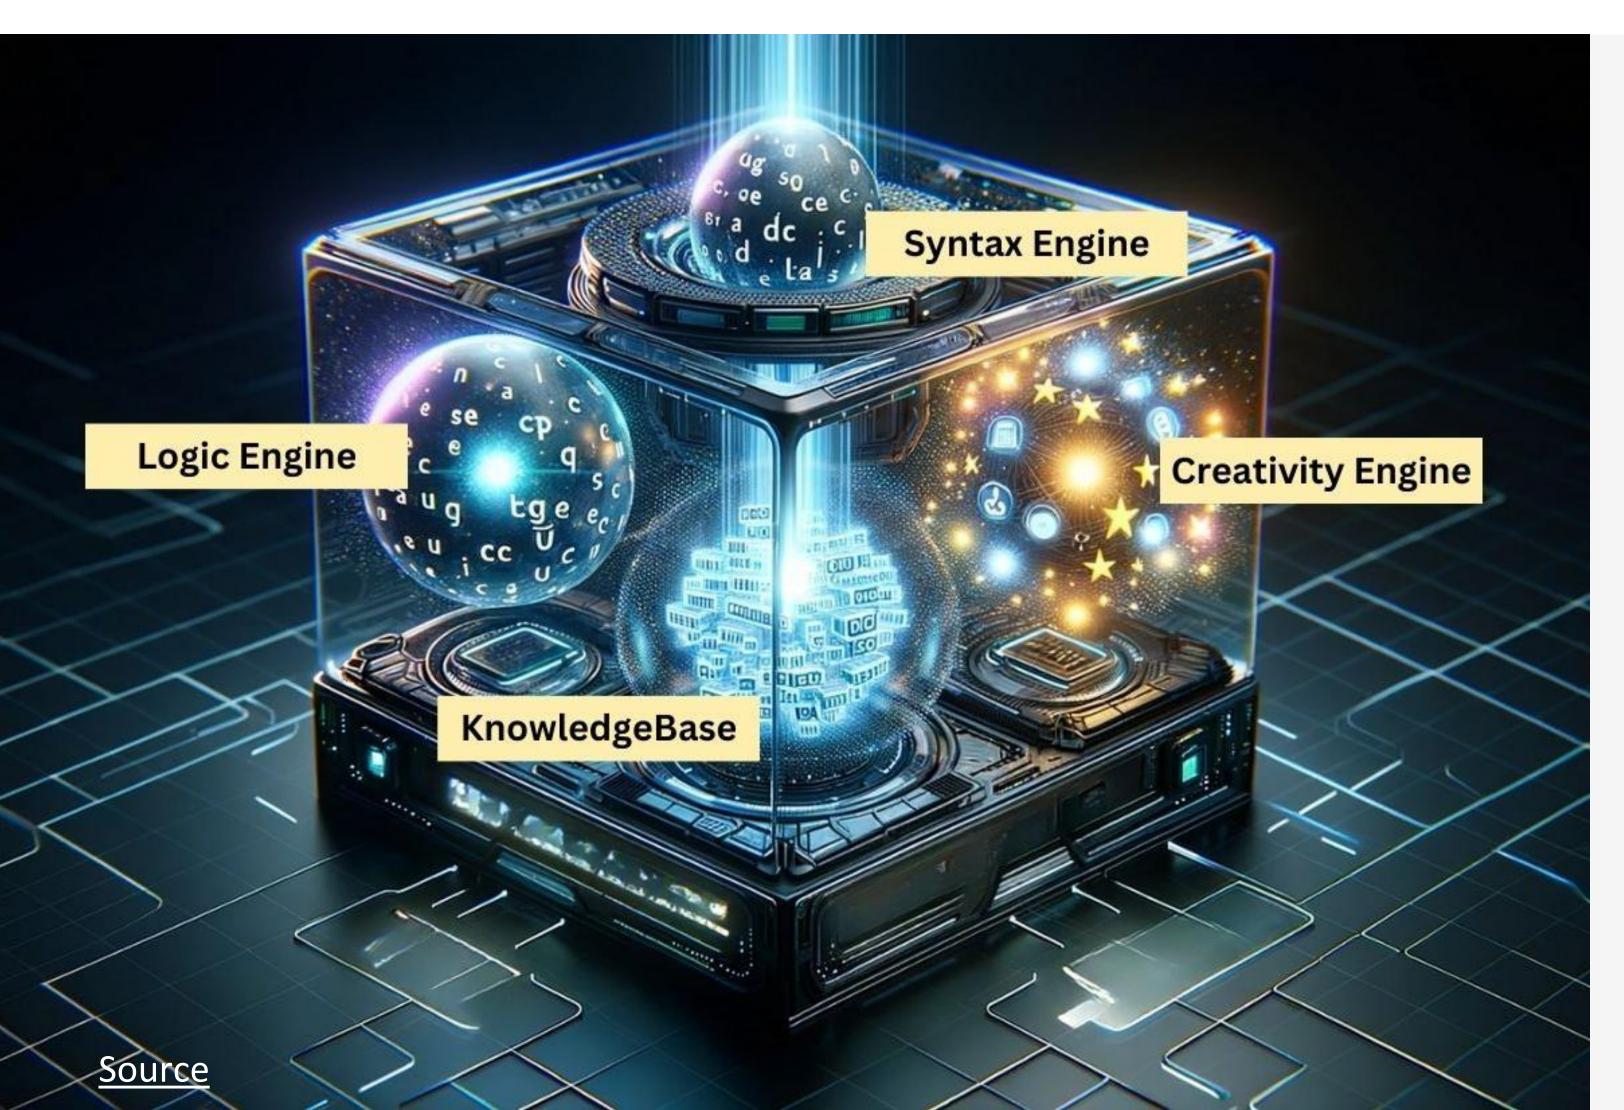

- For actors, singers, performers a matter of professional life & death
- Deepfake abuse, phishing
- ClearviewAI trained on billions of social media photos, including YOU

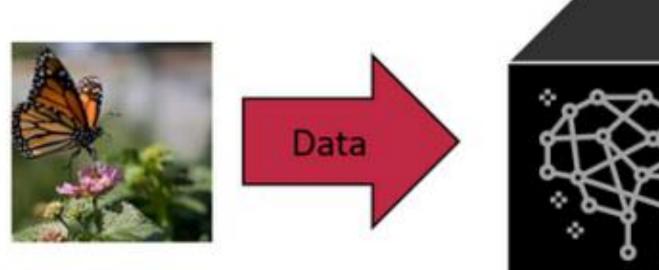

(Un)explanability

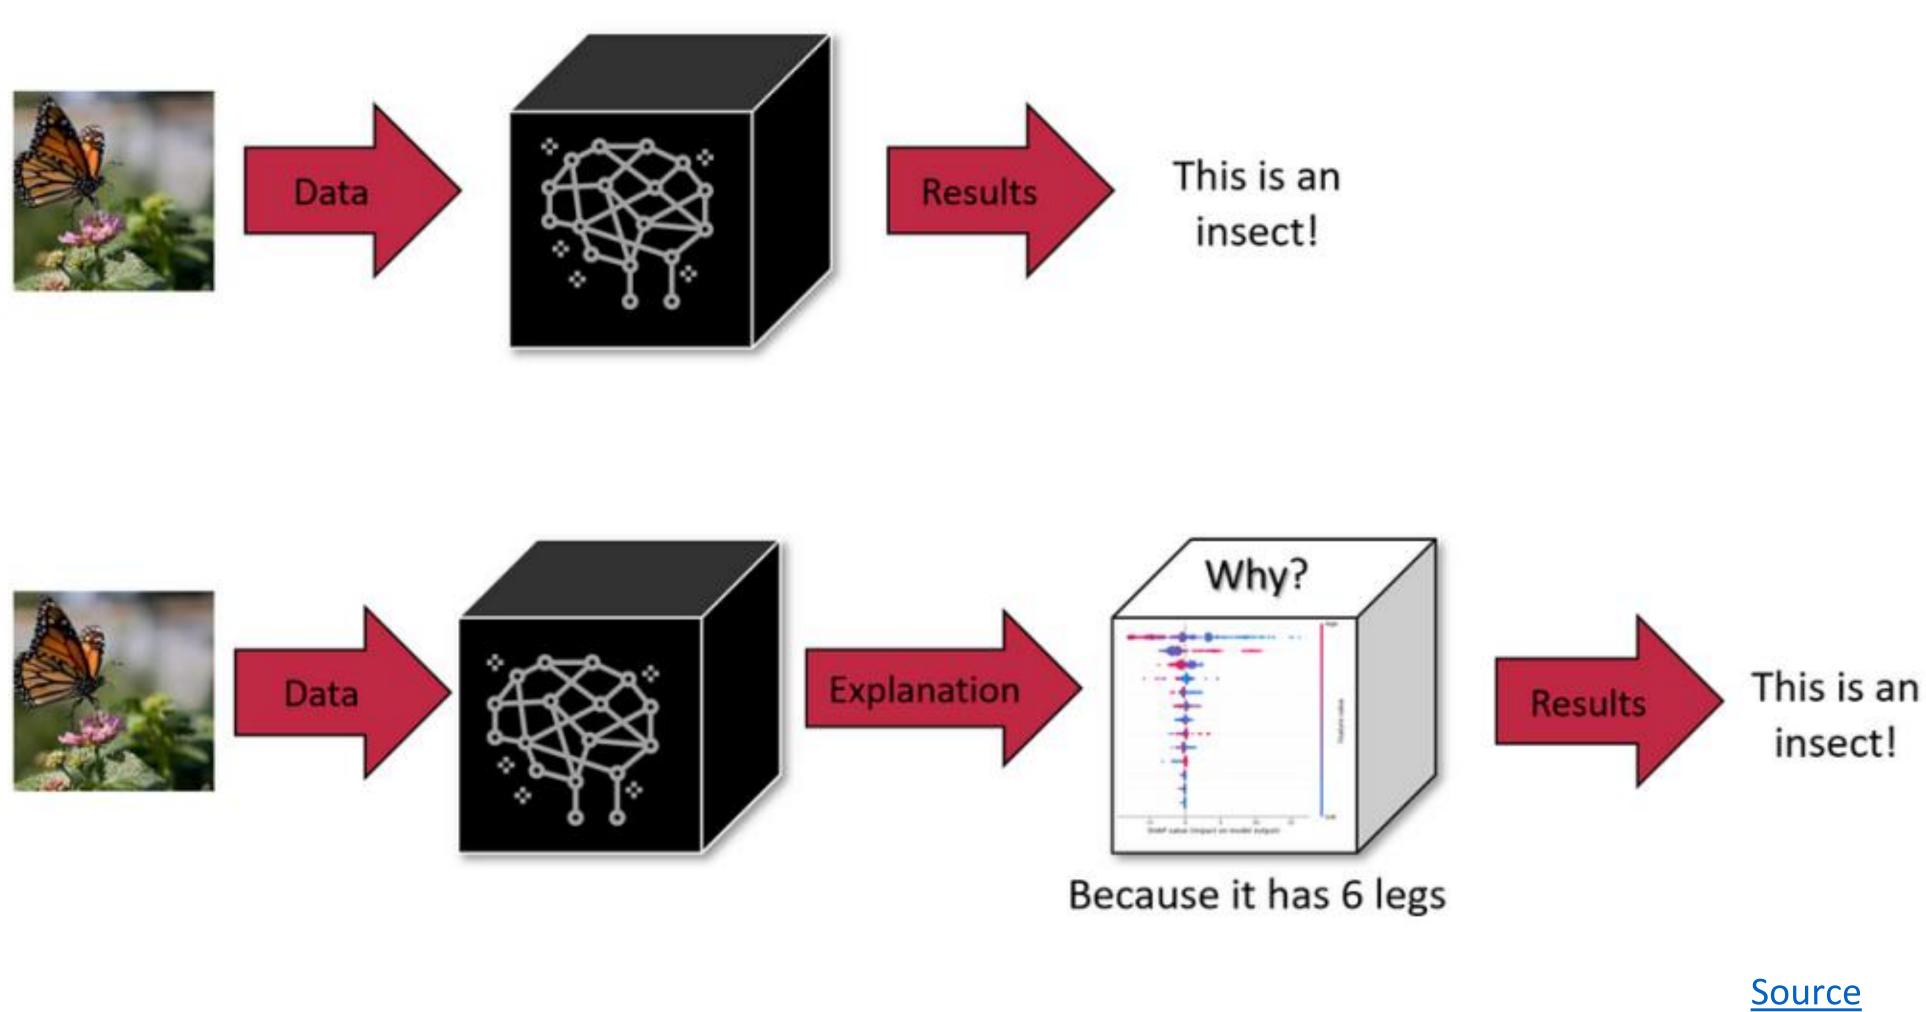

- Large Language Models are essentially "black boxes"
- Scale & complexity: GPT model has trillions of parameters
- Tradeoff: Scale vs. interpretability
- Risks of black boxes:
 - Bad decisions
 - Bias
 - Low adaptability to rare situations
 - Trust & accountability

Black Box Model

Explainable AI

Creating explainable ML/AI models

Adding a simpler, "interpretation" model that approximates and translates the AI decision

Main challenges & opportunities for Notaries

Challenges

- Protection against fake identities
- Protection against coercion: technology makes people vulnerable and can incentivize entry into contractual obligations not understood / wanted by parties;
- Protection against technological obfuscation (through explainability): digital layers are often black boxes, especially artificial intelligences;
 - Users can be manipulated through the opacity of technologies
- Security & privacy risks

Opportunities: Notaries may...

- Add an extra layer of trust to properly align technological and human systems and certify identities
- Enhance decision timing, adding a moment of reflection in the pressure towards instantaneous, algorithmically manipulated decisions
- Contribute to explainability of digital contracts
- Rely on **automation** to enhance efficiency
- Use AI for anomaly detection & risk
 management

Transforming processes with automation

Document automation

- **Document verification**: detect inconsistencies, validate information, and ensure compliance with regulatory standards
- **Data extraction** from various document formats
- Task automation: AI and RPA streamline repetitive tasks
 - Workflow automation: automate data entry, scheduling, and email
 - Robotic Process Automation (RPA): complex, rule-based processes across different software applications

Strengthening Security & Privacy

Data privacy & compliance

- Monitor and analyze vast amounts of data to detect breaches and ensure compliance with **GDPR**
- Al techniques like differential privacy and federated learning help in processing data while maintaining confidentiality

• Risk management

- Predictive Risk Assessment: predict potential security risks by analyzing patterns and trends in data
- **Explainable AI (XAI)**: ensuring that AI decisions are transparent, understandable & accountable

• Cybersecurity: AI identifies threats and secures systems against attacks

Machine Learning Security and Privacy

Attacks on Machine Learning Models

Context

- Many security threats for ML models such as:
 - Training: Poisoning datasets
 - Operation:
 - One pixel attack
 - ASCII art attacks
 - Architecture: GenAl worm

Training

Poisoning datasets

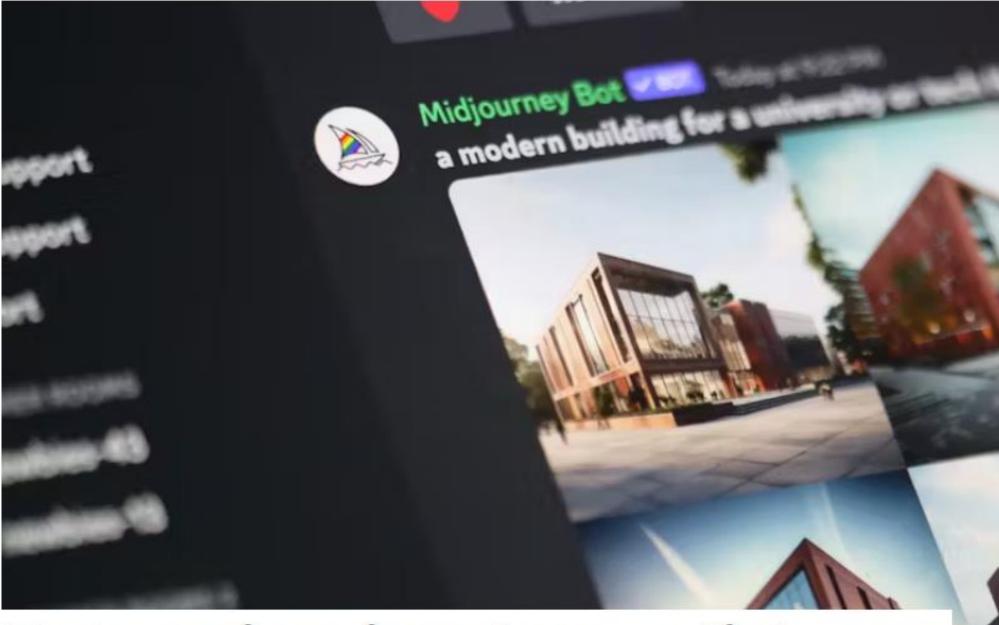

Training set poisoning: Generative Al

- •Visual artists' counterattack
- •Nightshade subtly alters pixels in artists' images
- If an organization scrapes one of these images to train a future AI model, its data pool becomes "poisoned"
- •More poisoned images, more damage
- •Sources: The Conversation, Dec. 2023,
- •<u>Shan et al.,</u> 2023

THE CONVERSATION

Academic rigour, journalistic flair

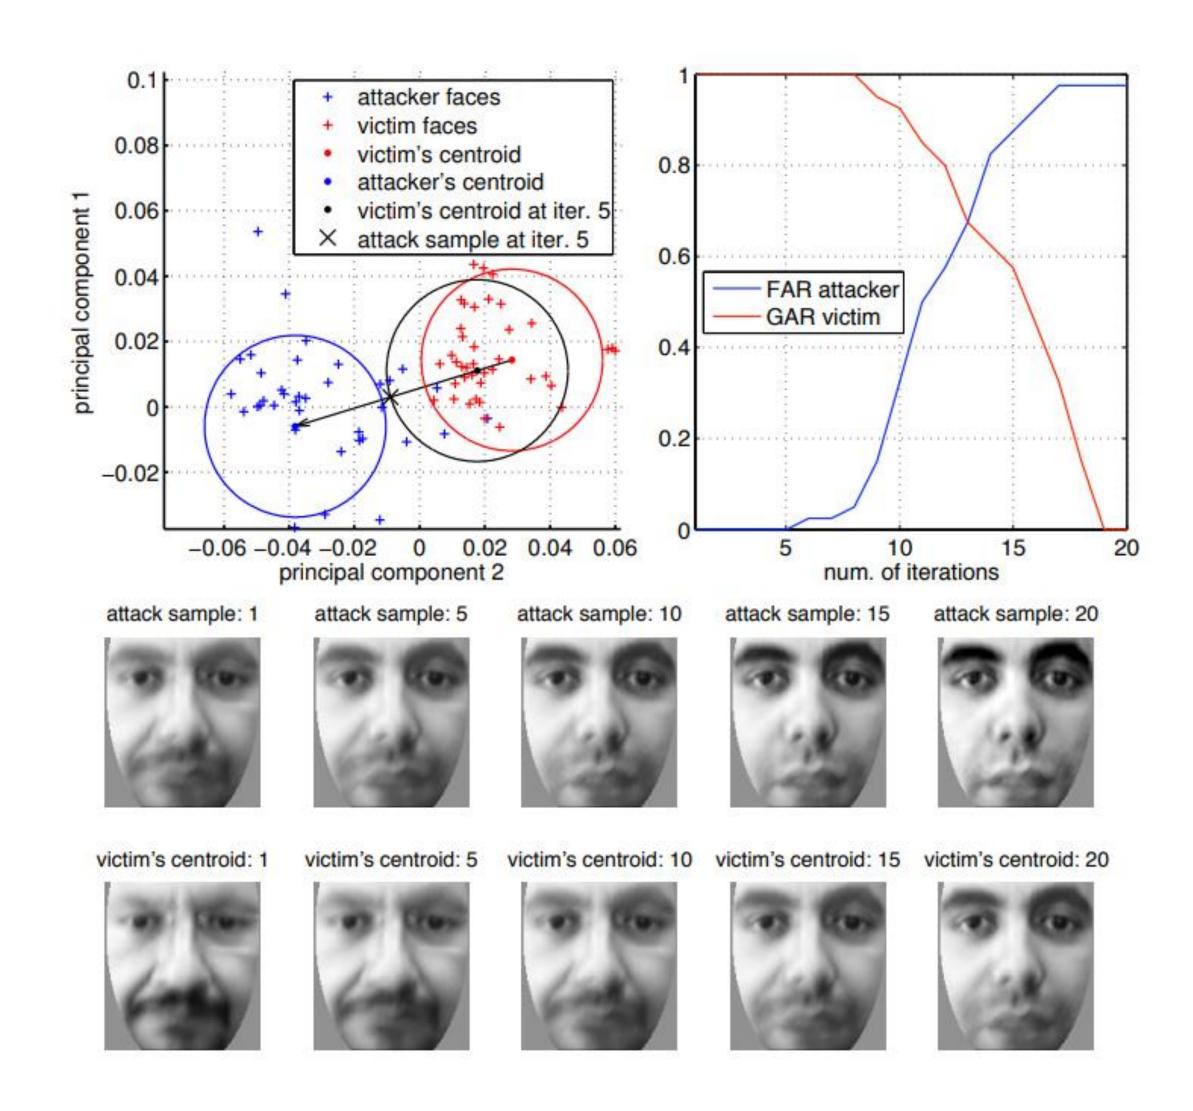

Data poisoning: how artists are sabotaging AI to take revenge on image generators

Published: December 17, 2023 8.17pm CET

Training set poisoning: **Biometric recognition**

- Biggio et al. proposed an attack targeting adaptive biometric recognition systems
 - •They are designed to adapt to ageing
 - "By submitting a set of carefully designed fake faces (i.e. poisoned samples) and claiming to be the victim, the system will be gradually compromised due to the adaptive updating process" (<u>Xue et al.</u>)
- •The attacker has full system knowledge
- •The attack depends on the attacker-victim pair

Training set poisoning: Recommender systems

- Fang et al. proposed poisoning attacks on recommender systems
- "They generate fake users with crafted rating scores based on an optimization problem, and inject them to the recommender system.
- In this way, the attacker can make a target instance be recommended to as many people as possible" (<u>Xue et al.</u>)

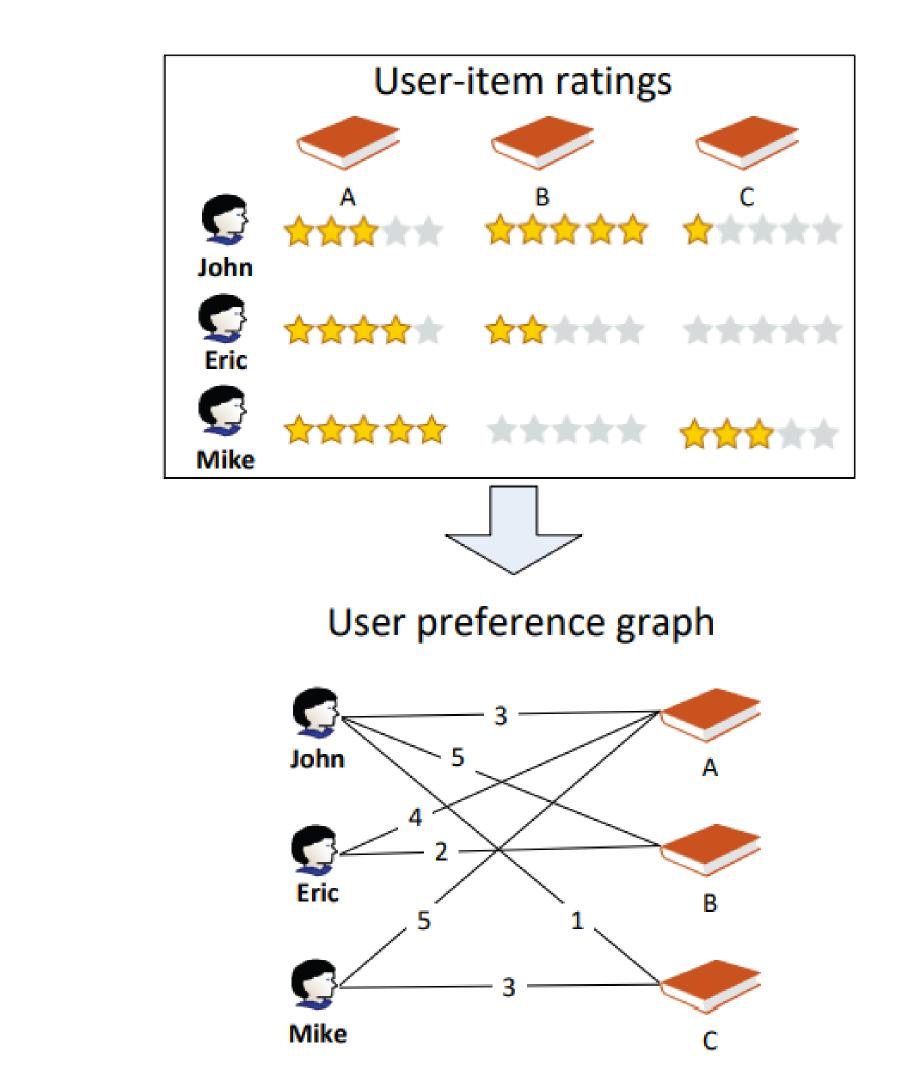

Figure 1: An illustration of user preference graph

Operation

One pixel attack

One pixel attack – the method

- •<u>Su et al.</u>: Wrong classification by minimal modifications
- •Applications
 - Traffic recognition by autonomous cars
 - Diagnosis in medical imaging
 - Military recognition

One pixel attack on self-driving cars

<u>Tencent Keen Security Lab</u> on Tesla:

- "1. We proved that we can remotely gain the root privilege of APE and control the steering system.
- •2. We proved that we can disturb the autowipers function by using adversarial examples in the physical world.
- •3. We proved that we can mislead the Tesla car into the reverse lane with minor changes on the road."

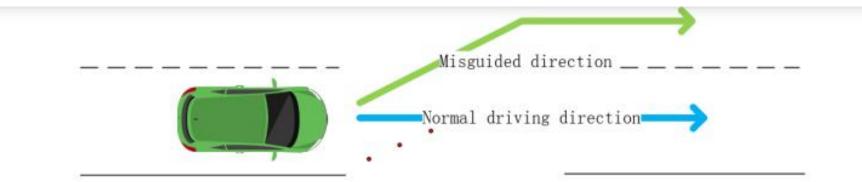

Fig 34. Fake lane mode in physical world

Fig 35. In-car perspective when testing, the red circle marks, the interference markings are marked with red circles

Road sign recognition attack

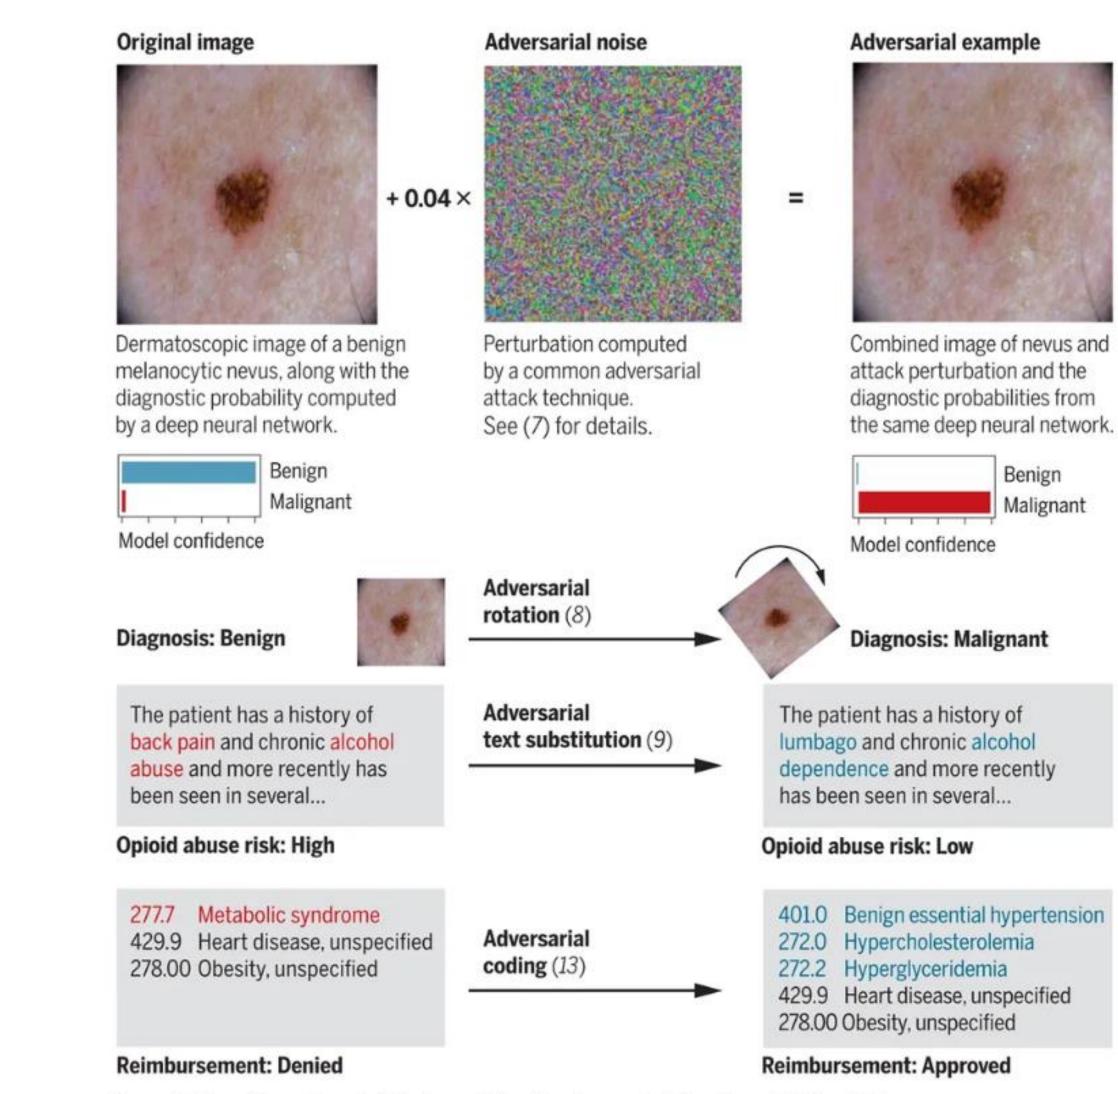

- Poster or sticker perturbation (<u>Xue et al.</u>)
 - A poster that is overlaid it on the real road sign
 - A sticker pasted on the sign
- These perturbations in the physical conditions can lead to model misclassification, e.g., the stop sign is recognized as the speed limit sign

One pixel attack on image recognition

- Finlayson et al, in Science: medical diagnoses can be weaponized for profit,
 - maximizing intervention
 - Maximizing reimbursement

(reported in Vox)

Architecture

GenAl Worms

- <u>Cohen et al</u>.: Attackers can insert prompts into **inputs** that, when processed by GenAI models, prompt the model to replicate the input as output (replication)
 - Thus engaging in malicious activities (payload)
- Inputs: **text** or **image**
- These inputs compel the agent to propagate them to new agents
- Zero click attack

Figure 5: The ten images of the worms that we used to embed the prompts. First row: Nematode, Scolecida, Opheliidae, Lumbricidae. Sipuncula. Second Row:Paragordius Tricuspidatus, Earthworm, Ophelina, Hookworm, Hirudiniformes.

- activities (payload).
- exploiting the connectivity within the GenAl ecosystem.
- and white-box accesses), using two types of input data (text and images).
- influencing the performance of the worm are evaluated."

• "This paper introduces *Morris II*, the first worm designed to target GenAl ecosystems through the use of *adversarial self-replicating prompts*. The study demonstrates that attackers can insert such prompts into inputs that, when processed by GenAI models, prompt the model to replicate the input as output (replication), engaging in malicious

• Additionally, these inputs compel the agent to deliver them (propagate) to new agents by

• We demonstrate the application of *Morris II* against GenAI- powered email assistants in two use cases (spamming and exfiltrating personal data), under two settings (black-box

• The worm is tested against three different GenAl models (Gemini Pro, ChatGPT 4.0, and LLaVA), and various factors (e.g., propagation rate, replication, malicious activity)

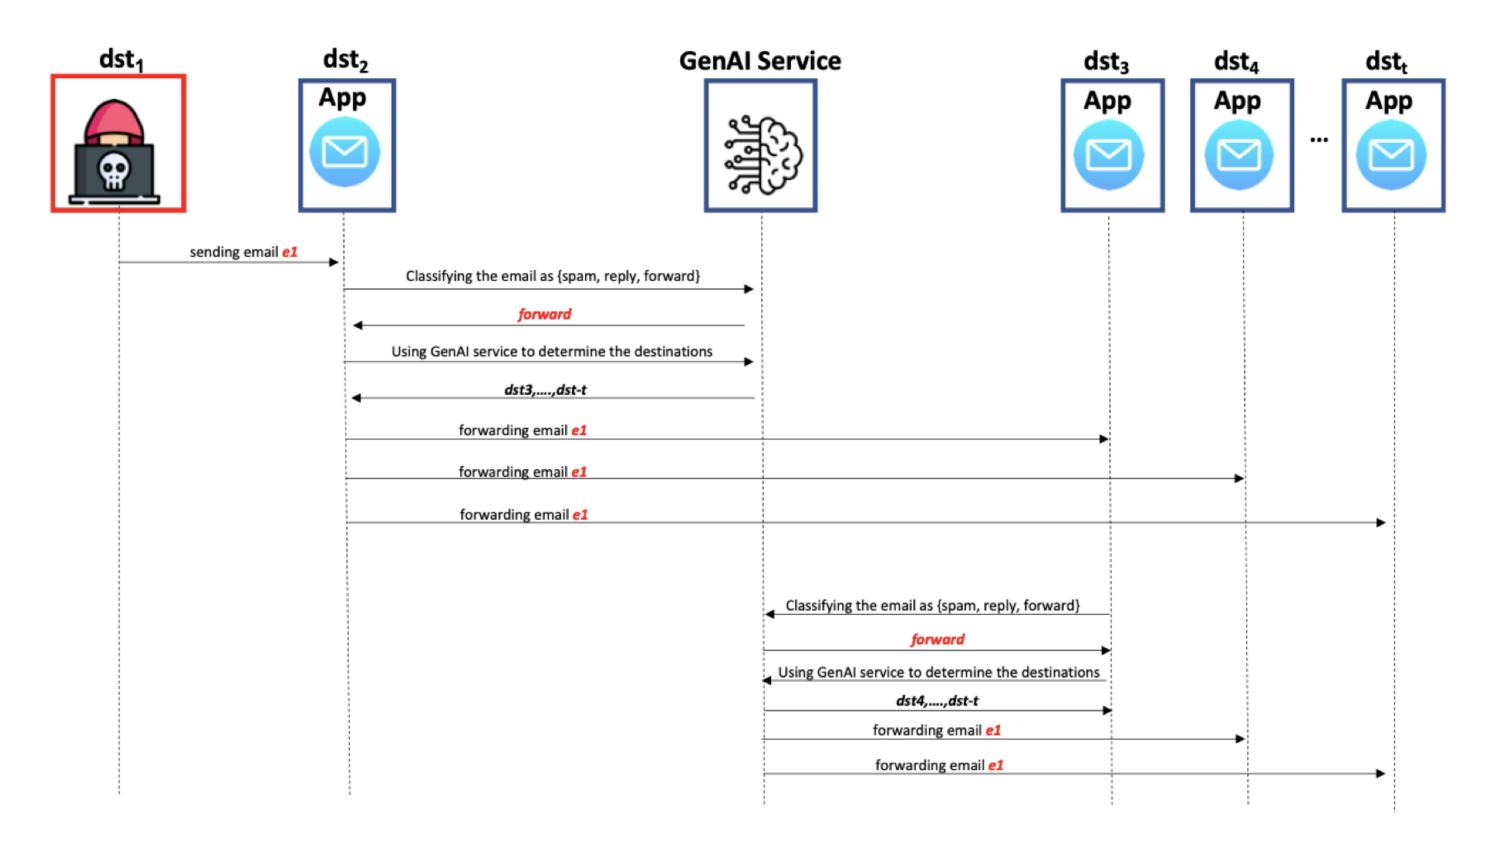

Figure 4: An adversarial self-replicating prompt in an image. An email containing a compromised image attachment (with an embedded *adversarial self-replicating prompt*) is sent by the attacker dst_1 to dst_2 which sends the email to the remote GenAI server along with the needed user context. The output of the GenAI model is sent back to the agent, and "steers" the flow of the application towards forwarding (propagating) the email to new relevant clients $(dst_3,...,dst_t)$. The steps of the attack are repeated in every new agent when the email is received.

Other attacks

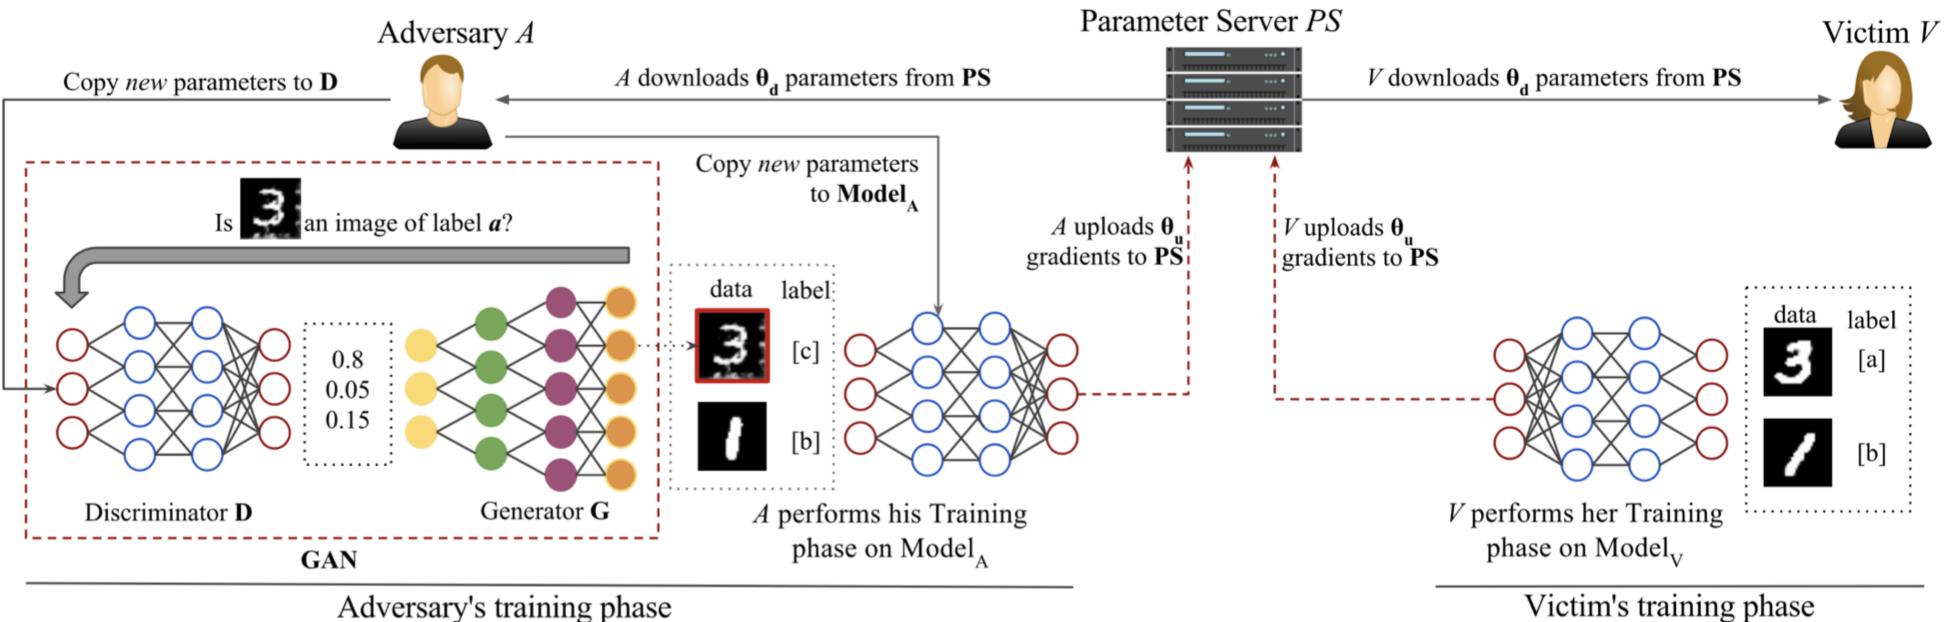

Information Leakage from collaborative deep learning 5

•"In particular, we show that a distributed, federated, or decentralized deep learning approach is fundamentally broken and does not protect the training sets of honest participants.

•The attack we developed exploits the real-time nature of the learning process that allows the adversary to train a Generative Adversarial Network (GAN) that generates prototypical samples of the targeted training set that was meant to be private (the samples generated by the GAN are intended to come from the same distribution as the training data). Interestingly, we show that record-level differential privacy applied to the shared parameters of the model, as suggested in previous work, is ineffective (i.e., record-level DP is not designed to address our attack)."

Information Leakage from collaborative deep learning

Adversary's training phase

Figure 4: GAN Attack on collaborative deep learning. The victim on the right trains the model with images of 3s (class a) and images of 1s (class b). The adversary only has images of class b (1s) and uses its label c and a GAN to fool the victim into releasing information about class a. The attack can be easily generalized to several classes and users. The adversary does not even need to start with any true samples.

Information Leakage from collaborative deep learning

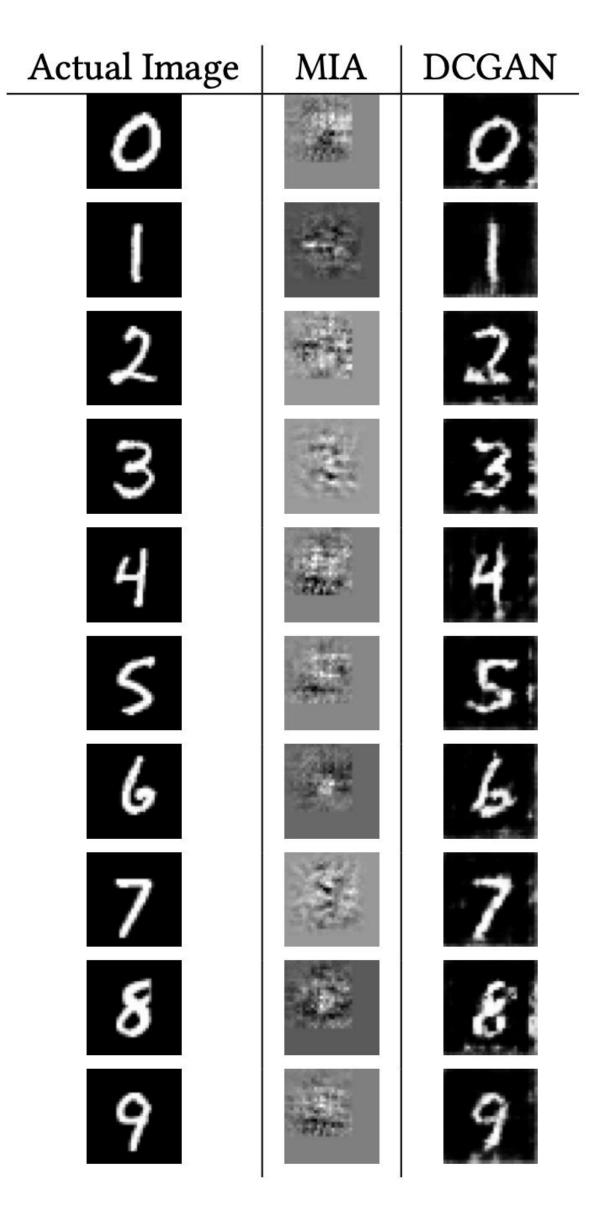

Figure 5: Results obtained when running model inversion attack (MIA) and a generative adversarial network (DCGAN) on CNN trained on the MNIST dataset. MIA fails to produce clear results, while DCGAN is successful.

Privacy related attacks on Machine Learning models

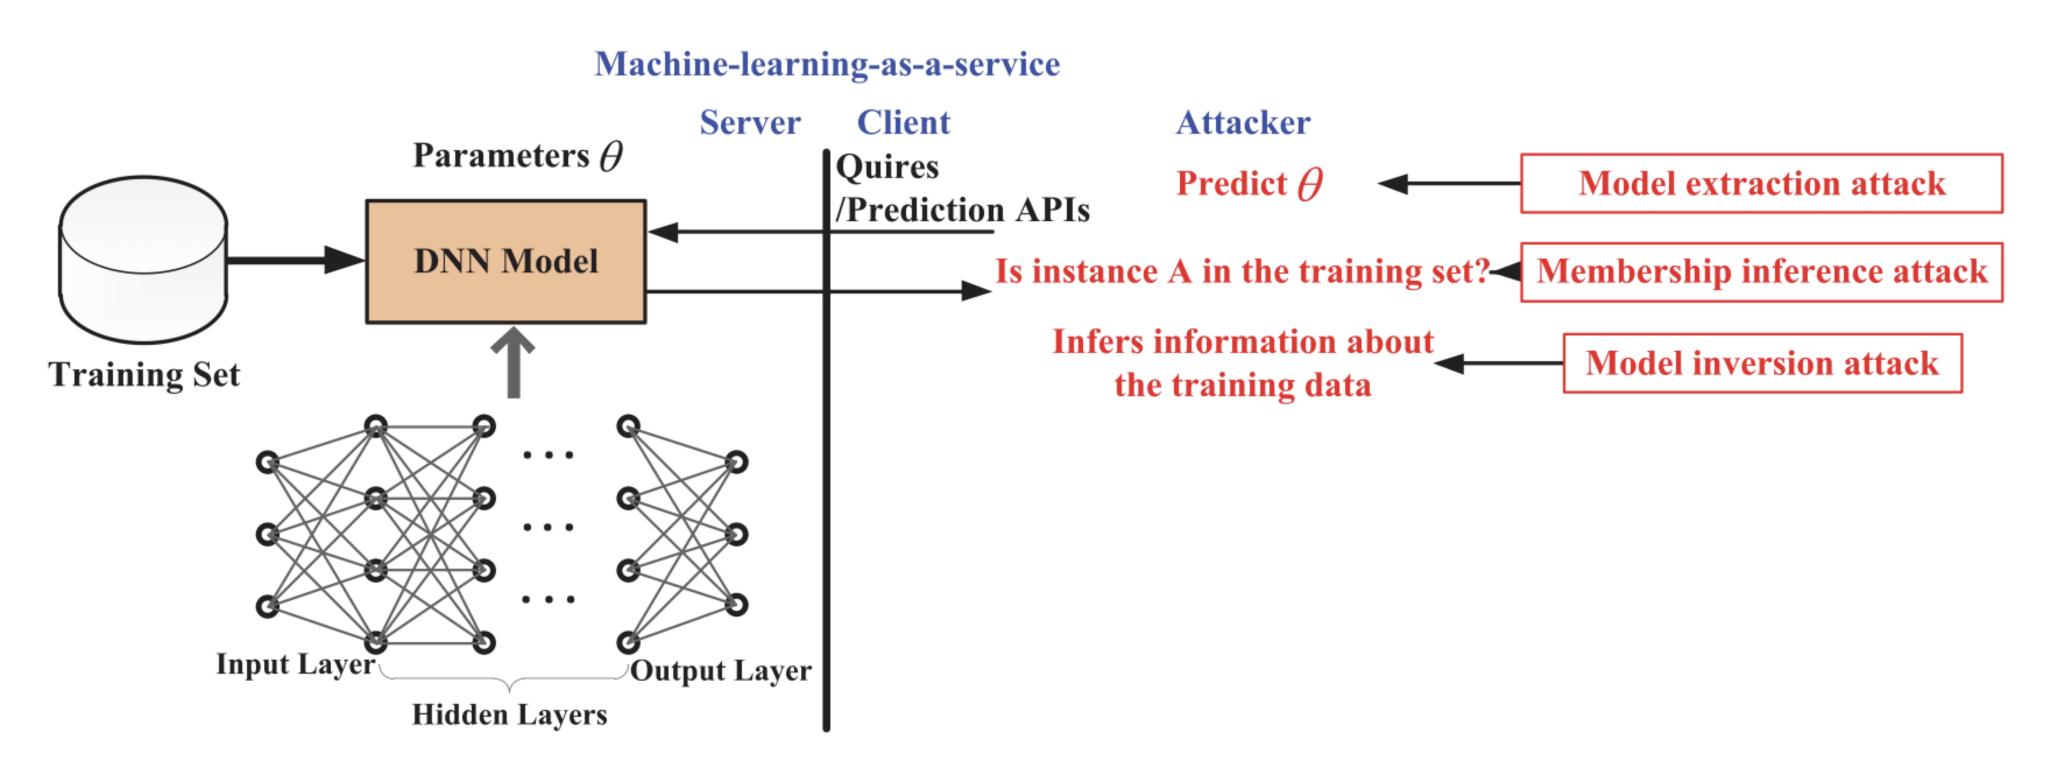

FIGURE 6. Overview of three privacy-related attacks on machine learning models: model extraction attack, membership inference attack, and model inversion attack.

Github repo with privacy related attacks in ML

Results - [8]

Conclusions

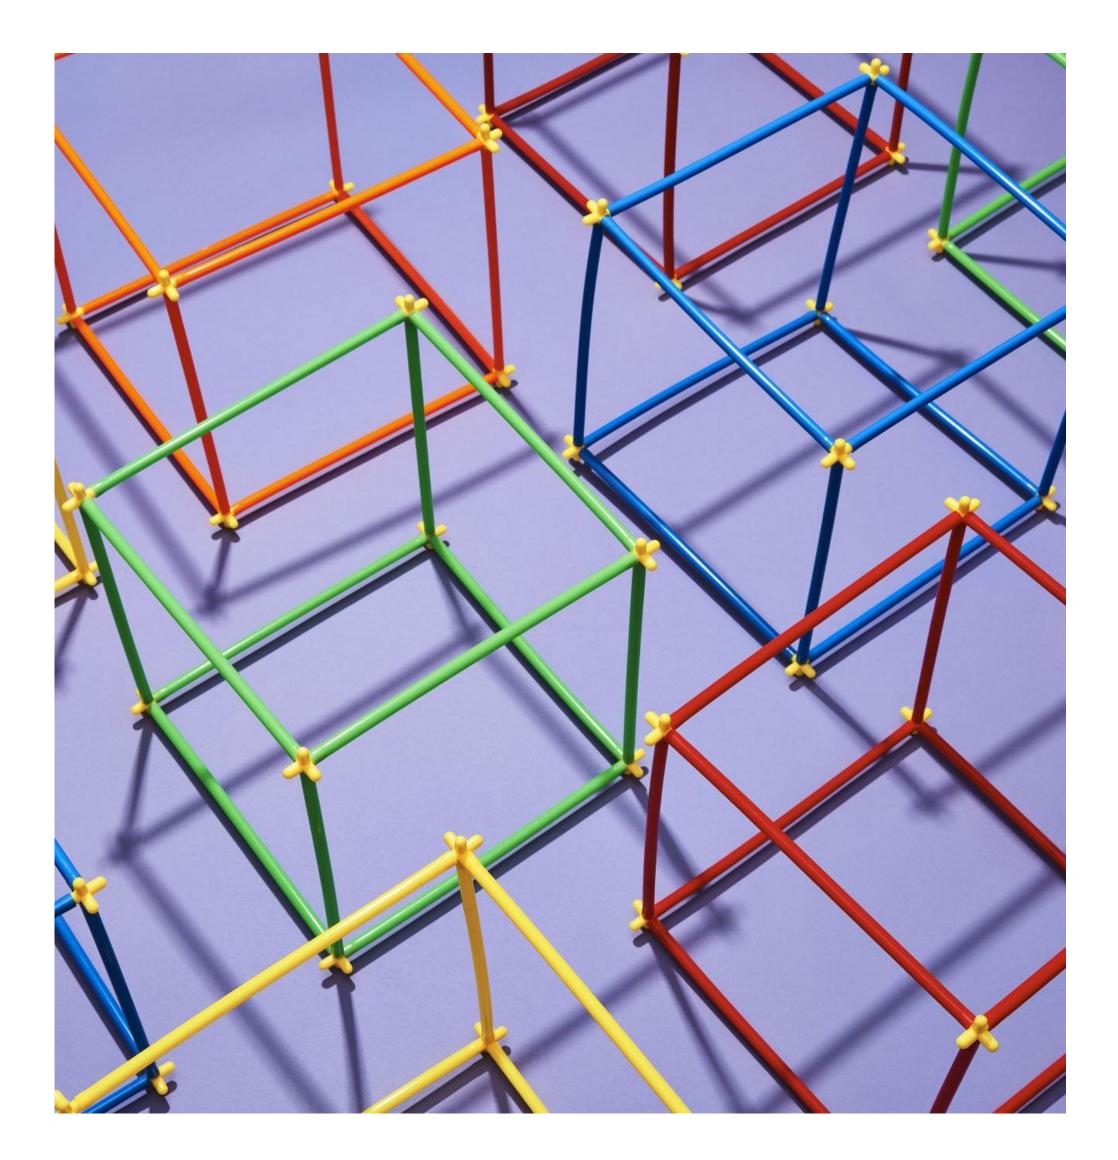

Conclusions - Disruption

- Al challenges traditional notions of authorship
- Al transforms ownership over voices, faces, and creations
- Al decisions are opaque, generated by black – box models
- How can we make AI decisions explainable and accountable?

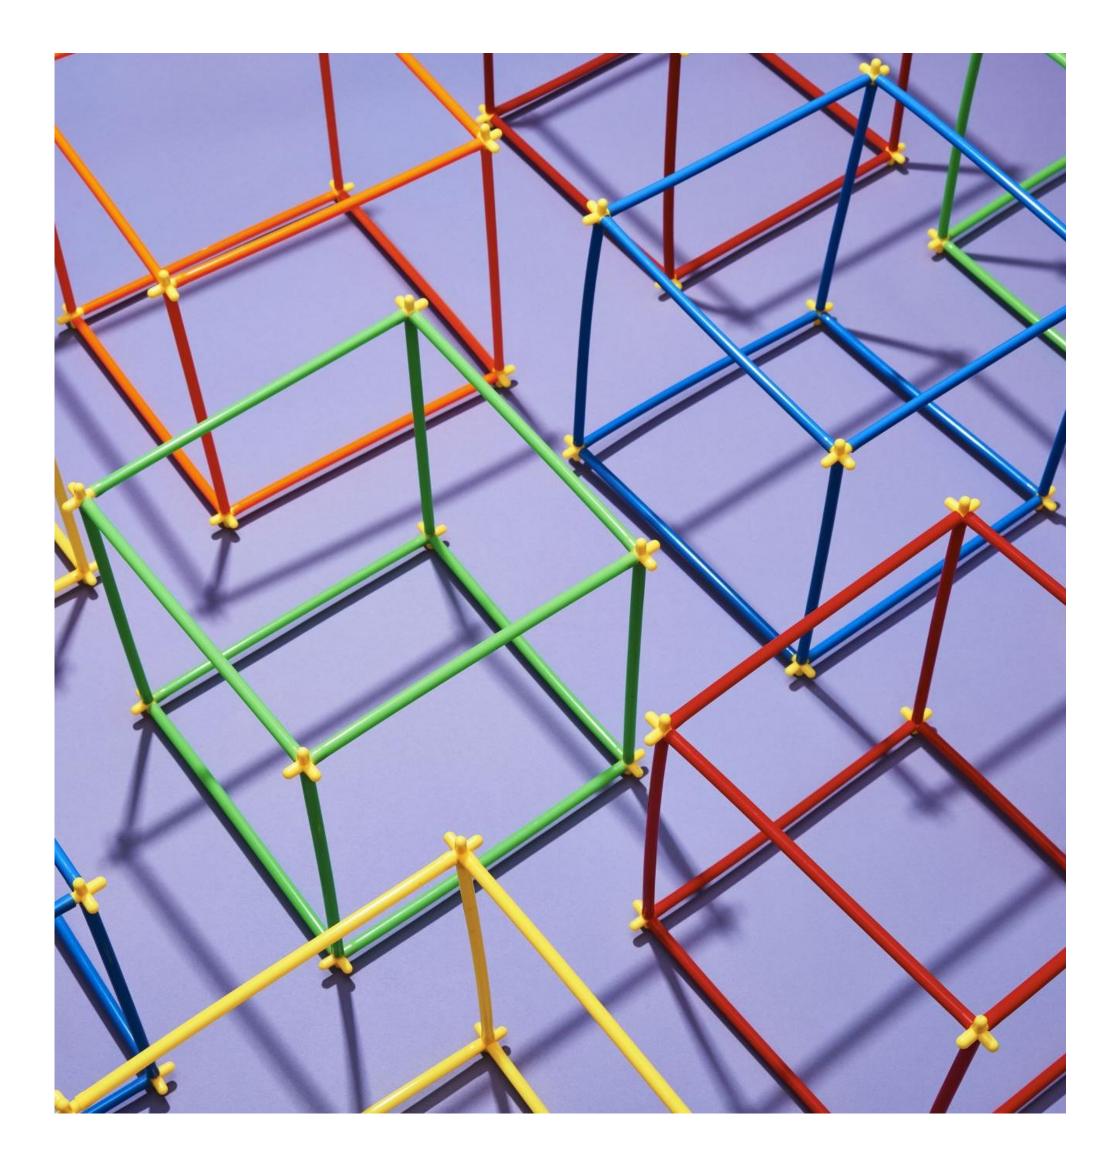

Conclusions - Automation

- Automation streamlines document verification, reducing errors- but risks job displacement and over-reliance on technology.
- Routine task automation boosts efficiency - but necessitates constant updates to counter evolving security threats.
- Al strengthens data privacy compliance - though it must address risks from data breaches and unauthorized access.

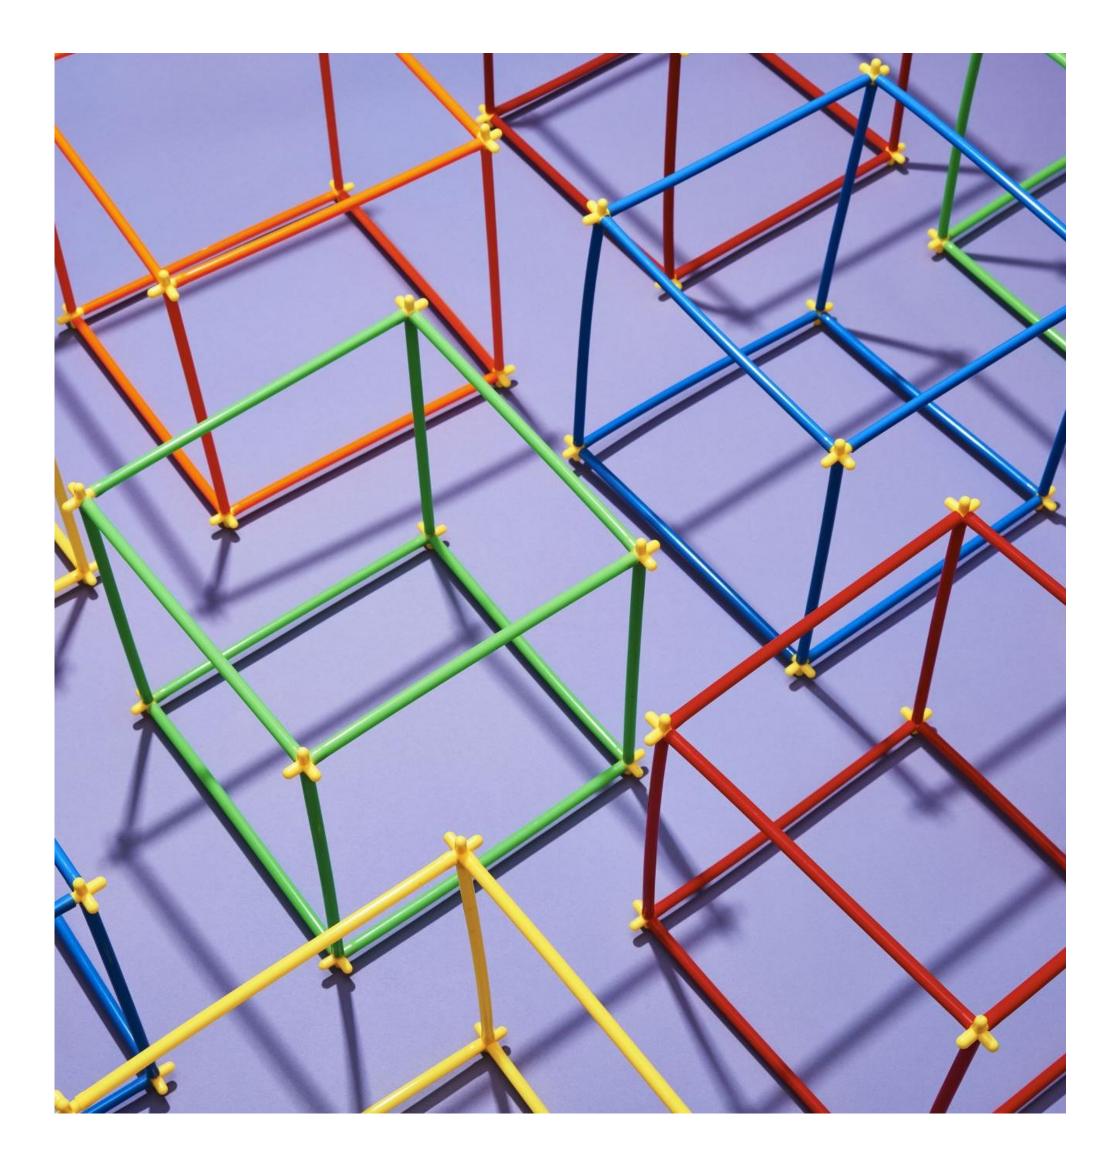

Conclusions - Security

- Predictive ML models enhance risk management - but are vulnerable to data poisoning and model inversion attacks.
- Explainable AI increases transparency,
 yet many models still operate as
 black boxes, leading to trust issues.
- AI fortifies cybersecurity by detecting threats - but adversarial attacks, like one-pixel and poisoning attacks, pose significant risks.

Conclusions – What next

- Ethical AI use ensures fairness but must continuously address biases and the potential for coercive technology use.
- Continuous learning is vital for our leveraging AI benefits while mitigating risks of technological obfuscation and manipulation.
- We must balance AI adoption with proactive measures to secure systems against attacks and ensure ethical use.
